

Promotion-abuse analytics

Turning 7.0bn đ of campaign activity into an explainable review strategy

SQL → Python → Power BI

Rule-based review score — not confirmed fraud

The decision: where review effort creates the most value

2.31%

review workload under the recommended rule

23.89%

promo cost captured by that rule

Review first

validate in shadow mode before any blocking

A small user segment carries disproportionate cost, but the correct action is prioritized review—not automated enforcement.

A three-phase path from campaign data to a review decision

3 phases

context → evidence → decision

A 6–8 minute stakeholder story focused on business judgment.

- 01

Context and scope

Dataset origin, campaign scale and the decision problem.
- 02

Evidence and benchmarks

Concentration, user signals and seven rule scenarios.
- 03

Decision and delivery

Recommended action, dashboard product and evidence limits.

Three questions turn campaign leakage into a decision

7.0bn ₪

credited promo cost inside the selected campaign

73 promotions · 254,309 transaction rows ·
90,555 campaign users

01

Where is promo cost concentrated?

Find the promotions and merchant categories that dominate exposure.

02

Which users warrant review—and why?

Use explainable signals instead of a black-box label.

03

Which rule balances coverage and workload?

Choose a practical review policy, not the broadest possible rule.

The campaign was chosen by a priority scan, not assumed

rank	campaignCode	campaign_id_count	transaction_rows	unique_users
1	CAMP_A	73	254309	90555
2	CAMP_B	4	19474	18115
3	CAMP_C	56	232246	21676
4	CAMP_D	2	22084	22084
5	CAMP_E	1	11455	1224
6	CAMP_F	7	5462	3147
7	CAMP_G	1	6967	4704
8	CAMP_H	1	1171	1033
9	CAMP_I	8	4235	3298
10	CAMP_J	1	1641	1409

Top 1 of many

Campaign CAMP_A
selected for deep-dive scoring

Campaign priority scan — all campaigns ranked

Rule-based review score — not confirmed fraud

254K transactions narrow to an 86K-user review population

254,309

transaction rows in campaign
Campaign CAMP_A

1 Jun–1 Aug 2022 · 90,555 users · 73
promotions

01

Campaign activity

193,295 successful rows · 7.004bn ₺ credited promo cost.

02

Analytical output

86,170 scored users · 3,671 prioritized for review.

03

Evidence boundary

No confirmed fraud labels; scores rank review priority.

SQL established trust; Python tested options; Power BI carried the decision

Trust gate 20 SQL↔Python outputs matched; slide 14 explains what this validates.

A six-signal score makes the review logic explainable

Behavioral evidence

- Immediate discount after joining
- High credited campaign discount
- Referral farming
- Shared-device usage
- Shared-IP usage
- Reciprocal transfer loops

0–2 points per signal

0–11

suspicion score

LOW 0–2

REVIEW 3–4

MEDIUM 5–6

HIGH 7+

The score prioritizes review; it does not prove abuse.

One promotion accounts for 74% of credited promo cost

5.18bn đ

credited promo cost in
Ref_CB_50K

74.02%

of campaign credited promo cost

Implication

Monitoring can focus on the dominant promotion instead of treating all 73 promotions equally.

A small user segment carries a disproportionate share of cost

Promo Cost Share by Risk Group

● Non-suspicious ● Suspicious

Unique Users by Risk Group

● Non-suspicious ● Suspicious

6.3x

cost concentration versus population share

1.89bn đ

credited promo cost linked to suspicious users

Peak daily share: 40.7% on 22 Jul

Concentrated exposure—not evidence of causation.

Suspicious users are almost always multi-signal cases

99.9%

trigger at least two current scoring signals

27.8%

trigger three or more signals

Most prevalent signals

Credited discount · transfer loop · shared IP

Seven rules define the trade-off between coverage and workload

All seven rule scenarios — users flagged, cost captured, over-flagging

Share of flagged users with a baseline score below 3. This is an internal consistency proxy, not a confirmed false-positive rate.

Rule	#Users	Promo cost captured	Low-score proxy share	Recommended Use
Medium balanced rule	1994	23.89	0.00	Candidate for controlled blocking test or high-priority review
New-account extraction rule	1193	13.83	0.00	Candidate for controlled blocking test or high-priority review
Referral farming rule	1080	14.45	0.00	Candidate for controlled blocking test or high-priority review
Broad monitoring rule	19332	68.02	83.47	Monitoring only; too broad for direct blocking
Shared device rule	23	0.06	13.04	Supporting rule; combine with other signals
Strict multi-signal rule	4	0.05	0.00	Supporting rule; combine with other signals
Transfer-loop review rule	537	2.57	0.00	Supporting rule; combine with other signals

Broad — too disruptive

68.02% cost captured
but 83.47% of flagged users score below 3

Balanced — recommended

23.89% cost captured at 2.31% workload
0% low-score proxy impact

Narrow — too little reach

1.25% to 0.005% workload
only 14.45% down to 0.05% captured

Only the medium-balanced rule pairs meaningful coverage with near-zero over-flagging.

The medium-balanced rule delivers the clearest trade-off

The red marker shows the medium-balanced rule — high capture at low workload.

1,994

users flagged

2.31%

review workload

23.89%

promo cost captured

54.32% of current score-3+ users captured · 0% low-score proxy impact

Every flagged user comes with a readable reason

Review queue — score, signals and reason

What a reviewer receives

- A suspicion score from 0 to 11
- The specific signals that fired
- A plain-language reason string
- A risk tier that sets review priority

The output is auditable at the individual level, which is what makes review defensible.

Use the rule to learn before using it to block

RECOMMENDED RULE AT A GLANCE	≈1.7bn ₪ promo cost placed under review	2.31% of scored users reviewed	0% low-score proxy impact
---	---	--	-------------------------------------

Exposure surfaced for review — not recovered value.

Immediate recommendation

Prioritize the dominant promotion and route medium-balanced-rule cases to high-priority manual review.

The dashboard turns analysis into a five-page decision path

Rule Decisions
Coverage vs workload

Retention & Quality
Context and caveats

Problem → exposure → behavior → decision → broader retention context

The evidence is reconciled—but the outcome is not labeled

20 / 20

SQL↔Python reconciliation checks matched

A transfer-loop self-join bug was corrected from an inflated 500,057 count to a distinct-partner maximum of 158.

What the project supports

- ✓ Explainable review prioritization
- ✓ Cost-exposure concentration
- ✓ Rule workload trade-offs
- ✓ Reproducible SQL↔Python checks

What it does not prove

- ✗ Confirmed fraud
- ✗ A true false-positive rate
- ✗ Causal campaign retention
- ✗ Readiness for automated blocking

Next evidence to collect: manual-review outcomes, network/ring labels and post-action customer impact.

Focus review now; automate only with evidence

Concentrated exposure and explainable signals make a targeted review strategy possible.
